## Bicycle and Bicycle

One articulation mechanism is disposed between a primary bicycle body and an auxiliary bicycle body, wherein the mechanism serves in synergy an parallelogram and a spring counteracts the deformation of the mechanism to maintain equilibrium. Both ends of the mechanism will be fixed on the bicycle bodies with two screws, the spring tension will be adjusted with another screw. Therefore, when bicycles turn or move on uneven surface, it can still keep moving stably, but will not overturn.

Both the primary bicycle and the auxiliary bicycle are ordinary bicycles. The juxtaposing link contains a turning bar, an articulation mechanism and a connecting rod.

If the auxiliary bicycle is rode by an adult, a supplementary handlebar can be installed on the connecting rod. It can be provided for child, the elder or the handicap to ride.

## Bicycle and Sidecar

It is convenient and comfortable for riders to carry their child or pets out to go for a bike ride. Young children are physically unable to

pedal the bicycle. Likewise, pets have no ability to step on the pedal of a bicycle, so it is economic and convenient for select a unicycle or, alternative, unicycle driven by motor.

make choices according to their needs. If a child is seated, a dinner plate can be installed on the connecting rod that is between the mechanism and the bicycle body.

The primary bicycle is responsible for the safe operation of the vehicle. The design of this model allows the user to

**Screw Thread Clamp**

The clever choice for extending carbon seatpost's life.

So, it hugs the carbon seatpost firmly, but not hurt the carbon fiber definitely. No worry to bear the one point clamping force and then damage the carbon seatpost as before.  
 Also, it is as a solution when the diameters of frame mast and seatpost do not match accurately.
